Part E — Business Insights

Finding 1 — Everyday customers drive the largest share of transaction activity

Finding:
The Everyday customer segment generates the highest transaction activity and overall transaction value among the four customer segments.

Evidence:

- Everyday: **5,644 transactions**
- Total transaction value: **₦261.46 million**
- Average transaction value: **₦46,325**
- Premium: 2,361 transactions and ₦107.75 million
- Student: 2,289 transactions and ₦107.48 million
- SME: 1,706 transactions and ₦83.79 million

Business Meaning:
The Everyday segment is an important contributor to FinTrust's overall transaction activity. Its high transaction volume means that changes in the behaviour or engagement of this customer group could have a noticeable effect on overall transaction performance. FinTrust should therefore closely monitor this segment when evaluating customer activity and transaction trends.

Finding 2 — SME customers have the highest average transaction value

Finding:
Although SME customers have the lowest transaction volume among the four segments, they have the **highest average transaction value**.

Evidence:

Segment	Average Transaction Value
SME	**₦49,115.69**
Student	₦46,953.20
Everyday	₦46,325.11
Premium	₦45,637.95

Business Meaning:
This shows that transaction volume does not necessarily indicate the value of individual transactions. SME customers conduct fewer transactions, but each transaction is worth more on average. This could make the SME segment important when FinTrust evaluates transaction value and customer behaviour separately from transaction frequency.

Finding 3 — Mobile App is the dominant transaction channel

Finding:
The Mobile App is the most frequently used transaction channel and also generates the highest total transaction value.

Evidence:

- Mobile App: **5,102 transactions**
- Total value: approximately **₦240.1 million**
- POS: 2,393 transactions
- Web: 1,869 transactions
- ATM: 1,747 transactions
- USSD: 889 transactions

The Mobile App accounts for approximately **42.5% of the 12,000 transactions**.

Business Meaning:
The Mobile App is a major point of customer interaction with FinTrust. Its high transaction volume and value indicate that digital mobile activity is an important part of the bank's transaction ecosystem. Understanding customer behaviour and transaction performance on this channel can therefore provide useful information about overall customer activity.

Finding 4 — Most transactions are successful, but a meaningful proportion require further investigation

Finding:
The majority of transactions are completed successfully, but 9.5% fall into failed, reversed or pending categories.

Evidence:

Transaction Status	Percentage
Successful	**90.5%**
Failed	5.2%
Reversed	2.7%
Pending	1.6%

Business Meaning:
The high successful transaction rate indicates that most recorded transactions reach a successful status. However, the remaining **9.5%** represent transactions that were failed, reversed or pending. Understanding where these outcomes occur—for example, by transaction type, channel or customer segment—could help FinTrust better understand transaction performance and potential service issues.

Finding 5 — Risk-reviewed transactions represent a substantial financial value

Finding:
Almost one in five transactions are flagged for risk review, and these transactions represent a significant amount of transaction value.

Evidence:

- Not flagged: **9,648 transactions (80.4%)**
- Risk flagged: **2,352 transactions (19.6%)**
- Value of flagged transactions: **₦161.78 million**
- Value of non-flagged transactions: **₦398.69 million**

Business Meaning:
Risk-reviewed transactions account for nearly **20% of transaction volume**, making risk-related activity an important component of FinTrust's transaction data. The ₦161.78 million associated with flagged transactions also shows that the pattern is financially significant. Further analysis by transaction type, channel, customer segment and international status could help FinTrust understand the characteristics of transactions that receive risk reviews.

Finding 6 — Transfers and card purchases dominate transaction activity

Finding:
Transfers and card purchases account for the largest transaction volumes in the dataset.

Evidence:

Transaction Type	Transactions
Transfer	**3,549**
Card Purchase	**3,033**
Bill Payment	1,475
Cash Withdrawal	1,430
Deposit	1,328
Airtime/Data	1,185

Transfers represent approximately **29.6%** of all transactions, while card purchases represent approximately **25.3%**.

Business Meaning:
Transfers and card purchases together account for more than half of all recorded transactions. This indicates that these transaction types are central to customer activity within the dataset. Analysing their transaction values, success rates and risk-review patterns could provide FinTrust with a clearer understanding of its major transaction activities.
